#### Abstract

In recent years, continuous capture chromatography has moved from a concept on the benchtop to pilot scale solutions, becoming an option for platform purification of monoclonal antibodies. This presentation focuses on the twin-column approach for the capture step. Through an on-site evaluation using industry relevant feed streams, this approach successfully demonstrated a flexible and easily transferrable process, resulting in up to 50% reduction in required resin and 50% reduction in buffer consumption while maintaining critical product quality attributes (CQAs). The accompanying software was used to quickly and accurately model the breakthrough of 3 different in-house mAbs, facilitating rapid process transfer to the pilot-scale equipment with yields above 90%. This flexible platform was tested using batch, continuous, and integrated modes of operation for the capture and polishing of molecules with reduced cost of goods. Looking forward, new approaches for integrated polishing steps can also be leveraged to further improve downstream process productivity.

### Introduction

• Evaluated batch and twin column continuous capture of mAb using YMC EcoPrime Twin 100 LPLC system

#### Results

#### Table 1:

Scale-down process configuration and productivity analysis

#### YMC EcoPrime Twin 100: 100L of 3 g/L Product

|  | Batch | Twin Column |
|--|-------|-------------|
| # of Columns                             | 1     | 2           |
| Column Diameter (cm)                     | 20    | 10          |
| Column Bed Height (cm)                   | 20    | 10          |
| Total Resin Volume (L <sub>resin</sub> ) | 6.3   | 1.6         |
| Binding Capacity (g/L <sub>resin</sub> ) | 40    | 60          |
|  | Batch | Twin Column |

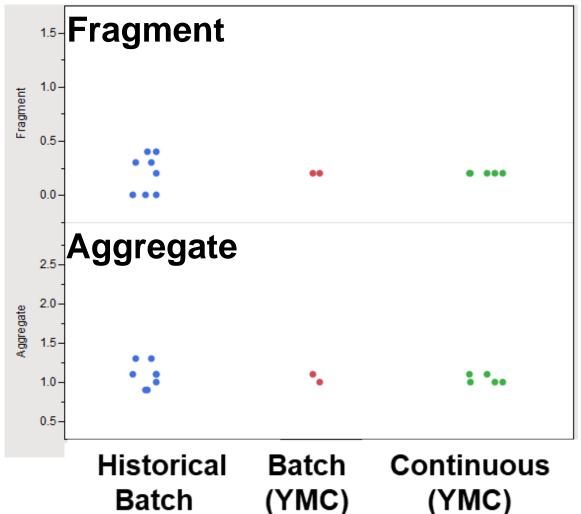

Figure 5. Continuous capture product quality data comparison

- Evaluated sequential polishing capability of YMC EcoPrime Twin 100 and compared to historical product quality parameters of batchprocessed mAb
- Compared productivity of continuous capture and sequential polishing process modalities to batch

#### **Methods**

#### **Batch and Continuous Capture Comparison**

- Single lot of mAb A was processed in both batch and continuous capture mode on YMC EcoPrime Twin 100 LPLC system using 10 cm x 10 cm affinity columns
- Batch capture column was loaded to 40 g/L
- Column load challenge was increased to 60 g/L for continuous capture method based on dynamic breakthrough curve estimate provided from YMC software

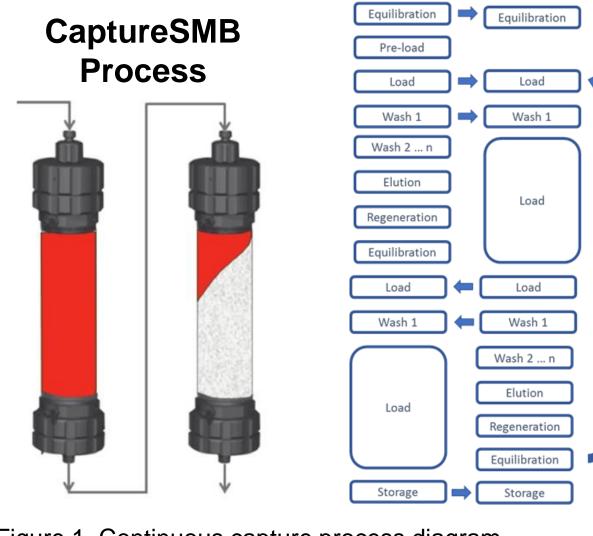

Figure 1. Continuous capture process diagram

**Sequential Polishing** 

| Process Time (hr)                        | 6                      | 9                     |
|--|------------------------|-----------------------|
| Buffer Requirement (L)                   | 300                    | 150                   |
| Resin Cost (\$16k/L <sub>resin</sub> )   | <mark>\$100,800</mark> | <mark>\$25,600</mark> |
| Productivity (g/ L <sub>resin</sub> -hr) | 10                     | 20                    |
|  |                        |                       |

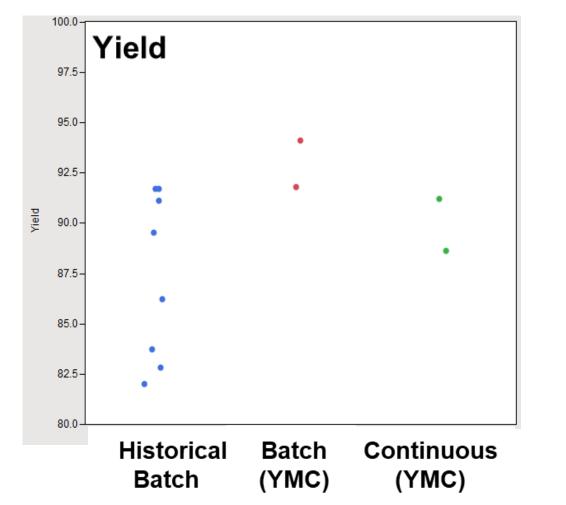

Figure 4. Continuous capture yield data comparison to historical batch runs, a batch run with the YMC system, and a continuous capture run with the YMC system.

#### (YMC) Batch

Figure 7. Sequential polishing quality and impurity comparison

#### **Conclusions and Future Work**

#### Conclusions

- Continuous capture processing with the YMC system can reduce resin cost and buffer volumes by 50% while maintaining historical yields and product quality attributes of batch-processed material
- Sequential polishing processing with the YMC system can condense multiple days of processing into a single day

#### **Future Work**

- Test inline buffer dilution capabilities and inline adjustment of sequentially processed material
- Explore ways to improve HCP clearance efficiency and process yield
